

Corrigendum in Cox and Magar 1999

APSR 93(2):299-309

October 18, 2022

The fourth paragraph in p. 302 of the published text reads thus

Our results, presented in Table 1, show that electorally less safe members, those on exclusive committees, those voting more conservatively, and first-termers all received more in receipts from business PACs, other things constant. Only the last effect, however, is statistically discernible from zero

it should be

Our results, presented in Table 1, show that electorally less safe members, those on exclusive committees, and those voting more conservatively all received more in receipts from business PACs, other things constant. And sophomores, with $\Delta Frosh_{it}$ scores of -1 , received less in receipts from business PACs, other things constant. Only the last effect is statistically discernible from zero.

Note: As $\Delta Frosh$ is a control variable in our study, and ours was a misinterpretation of the reported estimate (which is correct), the corrigendum has no impact in our findings nor our central claims. It will interest scholars focused on newcomer members of Congress.

Acknowledgement: The authors are grateful to Scott Ainsworth (personal communication October 16, 2022) for pointing our failure to take the cross-temporal perspective when interpreting the $\Delta Frosh$ coefficient in the text.
